Manufacturer and supplier of
Water and Waste Water Treatment Plants & Air pollution control devices
(ETP, STP, UF, RO, ZLD, Bag filter and Wet Scrubber)
"THE INDUSTRIAL POLLUTION CONTROL EXPERTS"

Welcome to Michelle Enviro Where innovation meets excellence. As CEO, I am proud to lead a team that is passionate about delivering top-notch solutions. Our mission is to drive growth, foster creativity, and build lasting relationships with our clients and employees. With over 15 years of experience and a commitment to quality, we are continuously on the track to become a company of choice. We have established ourselves as industry leaders. We are known for our excellent products and services. I also know the biggest challenge but often also the most rewarding aspect of my job is timely understanding what is going on the business so that I can apply the rules of law and minimize the risks for the company. Our brochure showcases our journey, values, and expertise. We are committed to protect our environment ultimately our planet earth. We wish you to explore our story and discover how we can collaborate to achieve success."

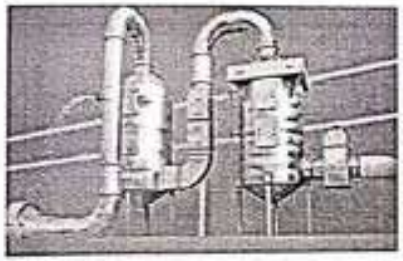
Wet Scrubber



Michelle Enviro is a leading manufacturer of wet scrubbers for boilers in India. We pride ourselves on our ability to custom design wet scrubbers to meet the specific needs of our customers. We use our expertise and innovation to create wet scrubbers that are effective at removing emissions and compliant with environmental regulations. We are committed to providing our customers with top-notch solutions that help them operate more cleanly and sustainably. For wet scrubber purchase query contact our sales team

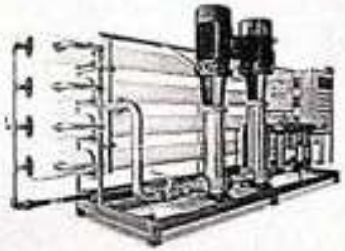
The exhaust gases of combustion may contain substances considered harmful to the environment, and the scrubber may remove or neutralize those. A wet scrubber is used for cleaning air, fuel gas or other gases of various pollutants and dust particles. Wet scrubbing works via the contact of target compounds or particulate matter with the scrubbing solution. Water is the most common solvent used to remover inorganic contaminants, particularly for dust, but solutions of reagents that specifically target certain compounds may also be used.

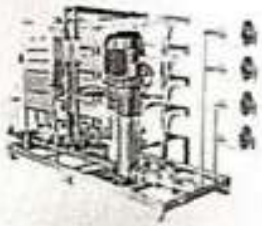
OUR MISSION

Established in 2017 Michelle Enviro is optimistic about innovating and manufacturing the plants that meet the requirements of our valued customers. Our goal is to make products with unbeatable quality, that last longer than the similar products available in the market. Setting a benchmark for other manufacturers to follow, we are committed to our mission and bring an end to the ever growing polluted environment and create a clean and breathable place, where only the clean water and clean air is provided for a healthy future for everyone. Where trees grow the birds nest, flora and fauna flourish, people in the surrounding places get healthy environment more importantly the children that are the future of our country get the best of health.

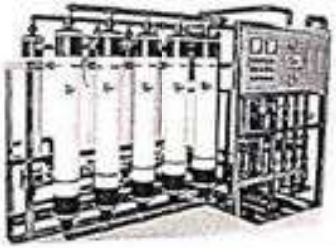
Our mission is not solely based on the business profit but also to safeguard and enhance the water quality for present and future generations by rectifying past water pollution and implementing sustainable solutions. We aim to create a world where clean water is accessible to all. Through our innovative water treatment products and exceptional services. We are committed to preventing this vital resource for the generations to come.

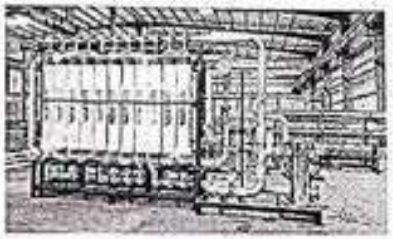
We look forward to continue to render our services and improve the quality to meet the futuristic goals in order to give our customer a value to their money. A healthy environment to our current fellow citizens and future generations. And resolve the pollution issue at the best possible way.



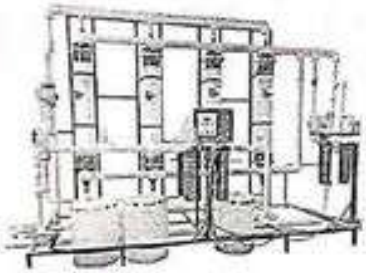


Ultra Filtration (UF)





An Ultra filtration (UF) plant is an advanced water treatment facility that uses membranes with extremely fine pores (typically 0.02 to 0.04 microns) to physically separate contaminants from water. By forcing water through these membranes under low pressure, the plant effectively acts as a barrier to remove suspended solids, bacteria, protozoa, and most viruses, while allowing water and essential dissolved minerals to pass through. This process is widely used to produce high-quality drinking water, as a superior pre-treatment for Reverse Osmosis systems, and in wastewater recycling, offering benefits like consistent water quality, low energy consumption, and minimal chemical use.



Sewage Treatment Plant (STP)

Transforming Wastewater into a Valuable Resource

At Michelle Enviro, we are specialized in the design, manufacturing, installation, and maintenance of customized Sewage Treatment Plant (STP). We partner with residential complexes, commercial facilities, municipalities, and industries to deliver reliable, compliant, and sustainable wastewater management solutions.

Our mission is simple: To safeguard public health and the environment by treating sewage to the highest standards for safe discharge or reuse.

The STP Process: From Contaminant to Clear Water

Our treatment plants utilize robust, multi-stage processes to remove physical and biological pollutants from raw sewage.

Preliminary – Removal of large, non-biodegradable solids using screening and Grit Removal and Separation of solid organic matter from the liquid by sedimentation (allowing heavy solids to settle as sludge).

Secondary (Biological) – Removal of dissolved and suspended organic matter using aerobic and biological degradation (using microorganisms like Activated Sludge or MBBR technology).

Tertiary (Advanced) – Final polishing to meet strict discharge/reuse standards by Filtration (Sand/Carbon) and Disinfection (Chlorination or UV).

Key Technologies We Offer:

We at Michelle Enviro deploy the latest proven technologies, allowing us to customize solutions based on site space, discharge standards, and required water reuse quality.

Moving Bed Biofilm Reactor (MBBR):

A compact, highly efficient biological process ideal for limited space and high load variations.

Sequential Batch Reactor (SBR): Uses a single tank for various biological treatment phases, offering high flexibility and minimal footprint.

Membrane Bioreactor (MBR): Combines biological treatment with membrane filtration to produce the highest quality effluent suitable for direct reuse.

Package/Modular STPs: Skid-mounted, ready-to-install units perfect for decentralized sewage management in smaller complexes.

Why Choose Michelle Enviro?

Guaranteed Compliance: Our STPs are engineered to consistently meet or exceed all regulatory effluent standards.

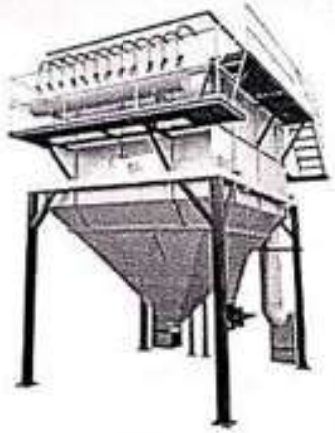
Focus on Reuse: We prioritize Water Recycling, enabling treated water to be reused for non-potable purposes (e.g., flushing, irrigation, cooling).

Operational Efficiency: Plants designed for low energy consumption, minimal sludge production, and fully automated operation.

Expert Support: End-to-end service from concept design and engineering to commissioning and annual maintenance contracts (AMC).

Did you know? The water recovered from a well-designed STP can significantly reduce your reliance on fresh water sources, offering massive operational savings.

Bag-House Filter



We at Michelle Enveb are more than just a manufacturing companyen are your dedicated partner in achieving stringent air quality compliance and maximizing boiler operational efficiency. With years of specialized experience, we have established ourselves as a trusted leader in the design, engineering, and manufacture of high-performance Baghouse Filtration Systems.

Our central mission is to help industries like yours manage Suspended Particulate Matter (SPM) emissions from boilers. The environmental, operational, and regulatory challenges posed by SPM are significant. That's why we focus exclusively on delivering robust, reliable, and custom-engineered Baghouse filters that effectively capture particulate matter, ensuring you meet or exceed all current environmental standards.

A Baghouse Filter is a high-efficiency air pollution control device installed on industrial boilers.

The core function is to remove Suspended Particulate Matter (SPM), such as fly ash and soot, from the boiler's exhaust system. Boiler Emission passes through long, cylindrical fabric filter bags. The solid particles are trapped on the fabric surface, forming a dense, porous layer called the "dust cake," while the cleaned air safely exits the system. Ensure the boiler's emissions comply with environmental regulations and prevent harmful particulate matter from entering the atmosphere.

Types and (Based on Cleaning Method)

Bag-House types are categorized by how they clean the accumulated dust cake from the bags. Bag-House Type cleaning Method Key Advantage: Pulse-Jet Short, high-pressure burst of compressed air cleans bags from the inside. Allows for on-line cleaning (no shutdown needed) and handles high gas flow rates. Reverse-Air A flow of clean air reverses direction, causing bags to slowly collapse and shed the dust cake. Gentler on the filter fabric, extending bag life. Mechanical Shaker The bags are mechanically shaken at the top to dislodge the dust cake. Simpler design, less common for large, high-temperature boilers.

Baghouse filters are considered one of the most effective particulate control technologies. * High Efficiency: Properly designed and maintained baghouses typically achieve collection efficiencies greater than 99% for Suspended Particulate Matter. * Fine Particle Capture: They are particularly effective at capturing very fine (sub-micron) particles. The dust cake layer that forms on the fabric is what drives this extremely high efficiency. * Influencing Factors: Efficiency is maintained by selecting the correct filter fabric (to handle high temperatures and chemical content) and optimizing the automated cleaning cycle.
